SOME DATA ON THE VOLGA-URAL INTERFLUVE.

L	
	The foregoing report aims to provide information on the Volga-Ural
	Interfluve, which covers the area limited by:
-	a) The left bank of the Volga River from Stalingrad downstream past
-	Astrakhan to the coast of the Caspian Sea;
-	b) The coast of the Northern part of the Caspian Sea from the Volga
	River delta to the delta of the Ural River;
	c) The right bank of the Ural River starting from its delta upstream
t	to the NP (inhabited area) of Kalmykovo (proposed location for the con-
ł	fluence of the projected Volga-Ural Canal;
+	d) The proposed outline of the projected Volga-Ural Canal.
	The following data concerning the Volga-Ural Interfluve territory
ļ	will be discussed in this report:
	1) Surface,
	2) Inhabited areas,
Ť	3) Flora,
1	4) Fauna,
1	5) Hunting laws,
+	6) Fishery laws,
-	7) Additional remarks.

COLUMN TONSTILL

1. Surface.

The surface of the Volga-Ural Interfluve forms a part of the Pre-Caspian Lowlands which embrace in a semi-circle the Worthern coast of the Caspian Sea from the SUIAK River past Volga and Ural River and as far as the Ust! Urt Hills.

The Interfluve constitutes towlands which are about 28 meters R15E5 below sea-level. The surface of the interfluve increases gradually from the coast of the Caspian Sea to the North*West from 28 to 11 meters below sea-level. There are sand massifs among the low areas in the South. The so-called "Ber" Knolls are located in the vicinity of the Volga Delta. They constitute parallel ridges which extent almost latitudinally. Their height reaches up to 25 meters, length - from 1 to 25 kilometers and width - up to 450 meters. See or river water, forming salt lakes or fresh water bayous, penetrate some of the low-lands between the ridges. The "Ber" Knolls are frequently covered with a layers of Loess clay formed by sands with deposits of gypsiferous dark-chestnut colored clay. Some of the knolls, have populated areas may be found. Low areas between knolls have frequently been turned into depressions formed as a result of the drying-of-salt-lakes. These-depressions-are-covered-with-a-thin-layer of salt under which may be found liquid clay or liquid salt. These depressions are called "sora" or "shora" (salt flats).

There are a great many lakes with thin coatings of salt on the bottom situated in the Interfluve territory. The water of these lakes is salty and bitter-salty. The majority of lakes in the Interfluve are dried up. In my opinion, there are at least 500 dried-out salt lakes in the interfluvial territory.

following should be mentioned: Backunchak, the Kamysh-Samarskiye Lakes, cooking the Karchayskoye Lake. The most important salt mines in the country are located at Baskunchak Lake. These mines provide as much as 30% of the total salt production in the country. Such rivers as the big and small Uzen' and a few others originating beyond the limits of Karka Kazakhstan and Astrakhan' Oblast do not enter the Interfluve territory getting lost somewhere in the sands North of this area.

Within the confines of Guryev Oblast, on the boundary with Astrakhan'
Oblast, there is a huge sand massif which is called "Urdinskiye peski".

BASED ON SOIL CONFIGURE
ACCOUNTY CONFIGUR

the following zomes:

- the village of Tambovka (located on the bank of the Akhtuba River, a distance of about 100 kilometers North and Astrakhan), from Tambovka extends it mantiages for about 120 kilometers in a North astern direction in where it intersects with the 48th degree Latitude North but not as far as follows:

 Bazan, axama a populated area. Here the boundary of the zone immaxima.

 North-Western direction and continues, parallel to the Volga, beyond penetrating

 Kazakhstan antering Stalingrad Oblast territory.
- 2) The zone of plain sandy desert—lands. It starts approximately at the village of Tambovka and runs parallel to the Volga-Akhtubinsk flood plain and Volga Delta (not hitting it closely) as far as the shore of the Black Sea. Then the zone boundary runs parallel to the sea-shore to where it crosses 50° 30 min. Eastern longitude and 47° Northern latitude. There the zone boundary turns North-East and extends for about 120-130 kilometers to wherexitxexeeex the intersection with the 48° Northern Latitude and 51° Eastern Longitude. There the zone boundary turns inexasymmateraxdirection west in a latifudinal direction as far as Bazan, a populated area, and from thereit runs along the boundary of zone "1" as far as Tambovka, a populated area.
- 3) The zone of plain clayey deserts. It approximately begins at 50° 30 min. East Longitude and 47° North Latitude North Latitude and runs along the sea-coast to the mouth of the Ural River. Then the boundary

-2- Partie Live Live Land

of the zone runs along the right bank of the Ural Riter approximately as far as the West-Kazakhstan Oblast border. From there the boundary of the zone turns South-West and extends almost straight to 480 North Latitude and 51° East Longitude to where it meets the boundary of zone "2".

4) The zone of plain sandy desert steppes; This zone is limited by zone "1" in the West, South and North-East it is limited by the zones "2" and "3". In the North, the zone boundary runs approximately latitudinally in a Wasterly western direction from the Ural River and comtimues a bit farther to the south of take the Kamysh-Samarski Lakes, the inhabited area of Novaya Kazanka, the Aral Sor Lake and almost reaches the Stalingrad Oblast boundary line.

In sum, according to the zone in the interfluvial territory, there is a predominance of Loess (alluvial clay), clayey sands, salty sands, solonchak mudbankds, and marshes and inaccesible swamps along the coast of the Black Sea. There are no rock formations in the interfluvial territory. The soil along the sea coast in the area of the Ural River delta and the soil of the Peshnykh and Rakushechnykh Islands are of a special nature. In some areas the coastal terrain consists of solid limestone with penetration to a considerable depth. The majority of 25X1 the Peshnykh and Rakushechnykh islands also consist of solid limestone with considerable depth penetration.

The landscape

on these islands (if one can go so far as to call it landscape) presents a distressing sight. There is not one bush, not a blade of grass; even moving around over this ground is a difficult matter. Nevertheless, people are forced to work and live on some of the islands.

Soil manyarration in the interfluvial territory is carried out both by means of local resources and under state direction, but progress so far has been on an exceedingly insignificant scale. Soil convergation is undertaken in two directions:

1) Measures are taken to protect fertile areas from flooding during the spring flood period. This applies mainly to the Volga-Akhtubinsk ر مادان المنظم المنظم

الأسالة الماستام الأ الماسالة

flood plain (local designation of it is "Zaymishche") and the Volga
river delta. These measures consist of reinforcing and building up
river banks (by increasing the height of river banks in order to keep the
water from running over them). However, such projects require the expenditure of much labor and proceed at a slow pace.

2) Irrigation and drainage, preparation of sandy soil for planting of forests. Soil drainage and irrigation is presently carried out by means local resources; such measures do not reach major proportions and are implemented in areas where fresh water is available. A government decree issued in 1948 called for construction of an automatic-flow main xx Volga-Ural canal 600 kilometers long. By Construction of this canal is designed to irrigate an area of about 6 million hektars of land. Construction of the Volga-Ural canal has not been launched yet, however. The intention was to start with the construction of the canal when a dam would be erected over the Volga near Stalingrad and the Stalingrad waterx reservoir x waterx shed reservoir formed. The preparation of sandy soils is a very important matter because in a number of places they extend direct all the way to the Volga river. Besides, the sands are continuously chruned up by roving cattle. The preparation of sandy areas is intended to be accomplished by the planting of forests and sowing of grass. Finally, plans have been developped for soil-preserving forestation along the banks of the Volga and Ural rivers. But the as it is with the preparation of sands, nothing has known happened to this plan so far. Both plans are only on paper. So far the sandy areas have not been prepared and soil preserving forestation has not been carried out. However, in 1949 and 1950 sees attempts in forestation were made in some areas but they all ended in a complete failure. There was no man-power CHOOLCHILDAEN AND and the effort to get people from towns and villages. Was HAD NO children to work on forestation projects for no pay provide practically aseless. The few-young-saplings which somehow managed to get into the ground died partly as a result of improper planting and those remaining alive were finally destroyed by roving cattle.

<u>4</u>-

It may be noted that a central station of the All-Union scientificreserach institute for reforestation, called "Bogdinskiy opornyy punkt", exists in Vladimirisk Rayon of the Astrakhansk Oblast. Soil-preserving forest strips were raised there. As a result a good crop of wheat has been raised, truck farming and fruit growing promoted and grapes cultivated. On the other hand, the Soviet government cannot take much credit for the success of this station. The "Boddinskiy opornyy punky" was established way back in 1925 with the help of scientists and the local pupulation. No other easis has been created in the interfluvial territory so far. There is no all-year around pastures for cattle grazing in the interfluvial territory. For that reason roving of cattle on the range predominttes. Patureland in this area can be found mainly in spring-time when the snow melts (as a matter of fact very little snow falls there and in some areas there is none at all) and spring-rains fall. There are winter pastures as well. Beginning of summer, when the grass becomes parched, cattle moves to other areas. Mainly sheep and two-hump camels are driven out to wilted pasture land. Large horned cattle grazes on flooded meadows. Cattle on wilted pastures afterxundxundixxunffer are frequently and severely exposed to sheet ice which is generally accompanied by strong North-East winds. In Kazakhstan this phenomenon is called "Dzhut", but in Astrakhansk Oblast it is called "Zhugan". Dzhut or Zhugan" come up suddenly. After thems a thaw and sometimes after a rainfall, when the air temperature is around O degree Celsius and even higher, the wind direction changes suddenly and sharply and the air temperature drops severely reaching down to 20 and even 30 degree below zero in 5515 In 1950 the Zhugan created terrible havoc among herds of thin-fleezed sheep in the "Chernyye zemlya".

Approved For Release 2008/11/14 : CIA-RDP80T00246A000800790001-6

2. Populated Places.

A	General	data.

There are two Oblast centers - Astrakhan' and Gur'yev and at least 150 populated places - Rayon centers, settlements, large and small villages located in the Volga-Ural interfluvial territory described here. I have attempted to list practically all more or less important populated places, beginning from the left bank of the main branch of the Volga as far as the right bank of the Ural river.

Rayon centers

The following populated places are located in within the confines of the Astrakhansk-sector-of the interfluvial territory:

- 1) Krasnyy Yar,
- 2) Marfino,
- 3) Narimanovo,
- 4) Kamyzyak,
- 5) Zelenga,
- 6) Obraztsovo-Travino (normallt it is called Travino),
- 7) Kapustin Yar,
- _8)_Vladimirovka,__
- 9) Kharabali,
- 10) Sasykoli.

The following Rayon centers are located within the confines of the Gur'yevsk sector of the interfluvial territory (their number is approximate only):

- 1) Ganyushkino,
- -2) Novobogatinskoye,-
- 3) Yamankhalinka,
- 4) Topoli,

based on rough figures the

⁻25X1

population of the interfluvial territory amounts to about 600-620,000 persons. The predominant majority of the population lives in towns,

Rayon centers, along river-banks and in delta areas.

Over half of the population of the interfluvial territory consists of Russians and Ukrainians, about 60%, then come the Kzaks, about 20%,

-6-

Constitution of

(they are, by the way, somewhat disdainfully called "korsaki"), Astrakhansi Tatars (they should not be confused with the Kazansk Tatars), about 12%, Armenians, Grusines, Jews, about 8%. The number of Jewish people living in the interfluvial territory is quite negligable. A very small percentage is of the Jewish minority mainly ranthraxarana concentrated in Astrakhan.

Almost half of the interfluve inhabitants (about 45%) are engaged in (about 35%) the fishing industry, a part is engaged in industry, transportation and administrative work and the rest of the population (about 20-25%) works on farms.

Remark: The statistics given above are a rough estimate.

B. Location of populated places and number of population.

25X1

1) The Astrakhansk sector of the interfluvial territory.

Thus By far the greater majority of populated places is to be found in the Astrakhansk sector of the interfluvial territory. Populated centers are mainly concentrated along the Volga-Akhtubinsk flood plain, along railroad lines and in the Volga river delta. These populated centers are as follows (starting from the North and going down to the sea-coast):

a) Along the Stalingrad-Astrakhan' and Saratov-Astrakhan' railroad.

Leninskiy,

Kapustin Yar (Rayon center),

Verkhniy Baskunchak,

Verblyuzh'ya,

Chapchachi,

Kharabali (Rayon center),

Vol'noye,

Akhtubinka,

Khosheutovo,

Dasang,

Astra khan' 2-ya (tovarnaya).

b) Along the bank of the Akhtuba and Volga rivers.

Canada Land

Kazakhs - about 10% (mainly in steppe animal husbandry areas),

Gruzines, Armenians, Jews - about 6-8%.

The population of Astrakhan' is engaged in fishing industry and other industrial branches (shipbuilding, ship-repair, machine-building, petroleum, woodworking, tanning, food and others). The pomulation of the flood plains (mainly Kaz of the Kharabalinsk, Kapustinoyarsk, Vladimirovsk, Sasykol'sk and a few other delta rayons - especially the Narimanovsk rayon) are mainly ----mellon-growing --engaged in truck-gardening and archardxenttivation as well as cultivation of rice, cotton, grape, but it also engages in fishing industry. The Marfinskiy population of the most of the delta rayons (Markinsk, Kamyzyakskiy, Zelenginskiy, Travinskiy and Western delta rayons, whose centers are located on the right bank of the Volga) is engaged in the fishing industry. But in addition to that it engages in truck-gardening and mellon-growing. The population of the extreme Eastern rayons of the flood-plain and delta, as well as steppe rayons engages in animal husbandry (sheep and and an Astrakhansk strain of large horned cattle).

A private sector of the economy is practically non-existant. Almost the entire population works in State, cooperative and kolkhose managed systems. The private sector forms an insignificant minority and consistay mainly of speculators and profiteers.

2) The Gur'yev and West-Kazakhstan rayons of the interfluvial territory.

The greater part of the population lives along the banks of the Ural river and the Eastern part of the Volga delta. The relative density of populated places in part of the West-Kazakhstansk Oblast is explained stretches by the fact that this territory is already beyond the desert and is to a larger extent supplied with fresh water.

Among the populated places in the Kazakhstansk sector of the interfluvial territory are the following:

a) Curiyevskaya Oblast.

Along the Ural river and along the sea-coast.

has greater salt content. In addition to wormwood, salsola grows
in solonetz soils. In sandy areas where sub-soil water is not far
is an abundance
down, there prexerristies of ephemerids - graminaceous plants
feather grass, wild rye, wheat grass, steppe grass, poa (genus of
grass), koster (?), coutch grass. These plants have a very short
moisture
vegetal period - one-two months. Spring maintains promotes rapid
growth-over a period-of one-two-months, but-when-summer-sets-in
all graminaceous plants burn up completely. Forests are practically
non-existant in the steppe areas; there is some shrubbery however.

The shore-line of the Caspian Sea, the banks of the Volga and Ural Rivers, are densely overgrown with bulrush, especially the Volga delta. Growth of bulrush in the Volga delta is so abundant that it forms impassable thickets (they are called Astrakhansk jungles).

Ural rivers. Along the Volga upstream from Yenotayevsk there are silver poplar, oskor' (?), willow, oak, aspen, acacia (there are a lot of acacia temes especially in Astrakhan' City). Along the Ural river, forest vegetation starts above Gur'yev. Trees may be encountered also in the flood plains and in the Volga delta. In this area an abundant grass crop may be found after the spring floods. Water fern, water mut (local name "Chilim") are found in the Volga delta in large amounts. "Chilim" serves as a food element to people. Sea grass, which is eaten by swan, geese and a certain variety of ducks, is present in large amounts another serves as a coves.

B. Cultivated plants.

Cultivated plants are bred mainly along the Volga and Ural rivers, in the Volga delta, in the surroundings of Astrakhan, Gur'yev and fishing settlements. Cultivated here are millet, wheat, potatoes, cabbage, different types of tomatoes, onions, carrots, sugar-beet, water-mellan, musk-mellon, pumpkin, orchard varieties like apples, pears, cherries, peaches, apricots, alychu (?), quince ("Astrankhansk apple"), grape. Besides, rice and cotton are planted, but on a small

C. Fish and marine animals.

There is an abundance of beluga, sturgeon, sevruga (called "kasnaya ryba") a sturgeon-like fish), many types of herring, vobla, bream, pike,

-15-

Carling 11.11

perch, lampery, white salmon, carp, Caspian salmon, Caspian sprat.

Remidesyxgrayxmaliatxamixfluorement Besides, fisheries along the shore of the Caspian Sea stocked the sea with grey mullet and flounder at the end of WW II. All these types of fish have industrial importance. Marine animals present there are, among others, the Caspian seals, which also have industrial value. Practically all the entire supply of seal (almost 100%) is obtained from the prikazakhstansk sector of the Caspian Sea. During the fall, the seal travels to the Gur'yev area farker in order to give birth.

D. Insects, molluscs, reptiles.

Agriculture is plagued by a huge variety of vermin - locusts, owlets, appletree-moths, among others. A real scourge in the interfluvial territory abe the mosquitoes, especially the Malaria. carrying variety. It is true that public health agencies carry out a vigorous campaign in their fight with mosquitoes but so far they the latter continue to terrorize the population there. The majority of the domestic population suffers from Malaria in one form or another In addition to Malaria, mosquitoes contribute to the spread of rabbit fever by carrying disease germs from water-rat to the person. The fight-against-mosquitoes is carried on with chemical agents and by breeding "gambuzii", a special type of fish. A great many ticks may be found also in the interfluvial territory. A real animal scourge in this area is the horse-fly. In particular, horse-flies infect animals with anthrax (Sibirian rakkitxferer) and rabbit fever. Some variety (the golden-eye horse-fly) even infects human beings with rabbit-fever. In the Volga delta one encounters molluscs, in the Caspian Sea sea-beetles. In the Volga- and Ural-delta huge numbers of frogs are present and the stagnant waters are full of leeches. Snakes are encountered in the steppes: - mainly the steppe viper., the yellow-pants runner as well as small lizards. Members of the game family serving ximong the x game x hat characters as a source of food for the population are: hare, antelope, gazelle, wild boar, swan, duck, all types of edible fish. People also consume seal oil (regarded as a remedy against anemia and tuberculosis). Insects, reptiles and frogs are not used as a source of food by the people of this srea. It even happens rarely that people would eat birds feeding on fish.

D. Domestic animals.

The following domestic animals are bred in the interfluvial territory:

- 1) Large horned cattle, among them Astrakhansk stock, which are provide an abundance of meat but little milk.
 - 2) Sheep, mainly fat-tailed sheep.
 - 3) Horses.
 - 4) Twin-hump camels.
- 5) Two types of pigs. One type feeds on bran and other cereals. Such pigs are much in demand and their meat is of excellent quality. The other type feeds on fish. These pigs and their meat the are in poor demand because the meat has a strong fishy figures; taste.
 - 6) She-goats.

In Astrakhansk Oblast as well as in Kazakhstan' camels karrakhana are harnessed to trained karrakhanak vehicles and thus are able to pull loads.

Central-Asian and South-Russian sheep-dogs are used to guard cattle.

These are very large, unpredictable and mean dogs, especially the South-Russian variety of sheep-dog.

5. Hunting laws in the interfluvial territory.

Basically there are two forms of hunting which are admitted in the interfluvial terribory, namely:

- a) Professional,
- b) Sport-& Hobby.

Rodents and wolves, especially the latter, are the objects of an all-out extermination drive. Hunting rodents and wolves is not confined to hunting seasons. As an incentive for extermination of wolves, successful full hunters are appared money prizes and additional supplies of ammunition and other hunting equipment.

-17-

Objects of sport-amateur hunting in the interfluvial territory are water-fowl, hare, wild-boar . Hunting antelope and gazelle is strictly prohibited. Professional hunting (on an industrial basis) does not exist in the interfluvial territory. Attempts were made, once atxonextimexorxxonather; to organize professional hunts of water fowl, but nothing came of the attempt and it was not repeated thereafter. Sport-amateur hunting is subject to certain regulations and seasons Amateur-hunters are members of a hunting club. A single standard hunting license is issued which authorizes a person to hunt for the period of one year. A state tax manakakaxpain is collected when the hunting license: is issued. The procedure of issuing hunting licenses is established by the USSR Ministry of Agriculture in coordination with the Ministry of Finance USSR. Hunting without a license or hunting with a license no longer valid is illegal and subject to a fincinxensexed fine in a case of first offense. The amount of the fine depends on the nature of the offense. Hunting licenses are issued to hunting societies. Regulations governing hunting itself are mix set up by the Councils of Ministers of the Union- and Autonomous Republics and Kray and Oblast Councils of Workers' Representatives.

The hunting season in the Astrakhensk and Gur'yevsk Oblasts starts on 1 September and runs till the end of November. Special government decrees on the subject of hunting periods have not come to my attention. In the Astrakhansk and Gur'yevsk Oblasts, hunting periods established by the Oblast Councils of Workers' Representatives. Notices to that effect can be found by hunters in the local Oblast newspapers. The Astrakhansk Oblast paper "Volga" used to carry, on page 4 in the last column, a notice which read as follows:

"To the attention of hunters

LEGAL

remains Hunting for water-fowl opens on 1 States September and markinus welld until 30 November and may be carried out in the following Rayons of the Oblast: Kamysyansk, Kaspiysk, Limansk.

Astrakhansk Oblast Council of Workers' Representatives".

Hunting is forbidden outside those Public areas indicated in the notice.

There are a great many amateur hunters in the Astrakhansk and engage

Gur'yevsk-Oblasts. However, at least 25% of the total number of in hunting in order to sell their game on the open market. Theresignifies kunterskink for the sparses of the total number of in hunting in order to sell their game on the open market. Theresignifies kunterskink for the sparses of th

geese, swan (hunting swans is not forbidden), teal, kachkaldaks (?), hare. A special permit is required for hunting wild boar. A first offense involving the killing of wild-boar without permission draws a fine up to 2,000 Rubles and confiscation of the boar killed. Besides this offense is punished by cancelling of the hunting license. However, unlawful killing of wild-boar takes place nevertheless.

A special fee need to not be paid when the hunting season opens. The tree for authorization to hunt is already included in the cost of a hunting license.

Amateur hunters use a number of junting rifles for hunting 25X purposes. The most common caliber is No. 12, after that comes 16 and 25X1 then 20, which is used very rarely, however (20 is used sometimes by a select number of sportsmen and especially good shots).

The

they are products of greater majority of hunting rifles are of domestic make, that is, from the Tula and Izhevsk rifle factory. After the war, a lot of foreign-make

hunting-rifles came into appearance.

mass-produced
The restriction The price charged for a standard doublebarreled gun of 12 caliber sold by the Tula and Izhevsk rifle
factories amounted to about 275-300 Rubles in 1951. A custom made
gun ordered at these same plants cost 900-1200 Rubles depending on
the type and caliber of the gun. A foreign-make gun (for instance
"Sauer 3 rings") cost 1,000-1,200 Rubles.

Hunting as a sport is extremely popular among leading partyand government officials. As a rule however, their hunting leads -up-to-sizeable-drinking bouts **** in the open air.

In conclusion it should be noted that it is difficult to buy
prepared charges in Astrakhan' and Gur'yev, as well as in other towns
in the USSR. Ordinarily, what is sold to hunters are powder, shpt

(provided it is in supply), wad, less frequently cartridges, and
hunters make their own rounds. This frequently leads to hunting
due to incorrect setting of the charge.

accidents **incorrect** as special store
hunting goods **shap** and a special hunting rifle shop in Astrakhan.

-20-

5. Laws regulating fishing in the interfluvial territory.

Two types of fishing are practiced in the Astrakhansk and Gur'yevsk Oblasts:

- a) Industrial fishing,
- b) Sports-fishing.

For industrial fishing, definite periods have been established:

- 1) The spring fishing season which usually begins end of March early in April and is in effect until end of June.
- 2) The fall fishing season, which begins end of August early in September and is in effect until end of November.
 - 3) Winter fishing under the ice.

Trawls, cast seines, stake nets, stake seines, fishing nets with electric lighting, venters (?) (for winter fishing under the ice) are used by the fishing industry to catch fish.

Sports-fishing is not confined to definite seasons. As the case may be in one location or another, limitations extend only to the use of one or another fishing tool or tackele. Fishing tackle and tools aubhorized_in_the_interfluvial_territory_for_use_of_sports_fishermen are the following:

- 1) spinner (American type).
- 2) fishing-rods for various kinds of fishing (bottom, hook, spoon bait, for winter fishing under the ice).
 - 3) German nets (widely used in Astrakhan' Oblast).

Sports-fishermen are forbidden to use nets, seines, trawls, automatic hooked takkele tackle (seines), hit the fish with a harpoon, shoot and stum them (with explosives). This kind of fishing is legally considered to be poaching.

Sports-fishermen are allowed to fish from the shore, from boats, bridges. Fishing tackle are by no means critical commodities in Astrakhan' and Gur'yev. Hooks are usually made in local artels and specialty shops of net-weaving factories. The hooks are of good quality. Not everybody can affort to buy spinners because they are quite expensive. Fishing rods most frequently consist of bamboo -الدَّوْلِ إِنَّالًا لَا السَّالَا مِنْ مُا اللَّهُ مِنْ اللَّهُ اللَّهُ اللَّهُ اللَّهُ اللَّهُ اللَّهُ اللَّ

6. Oblast centers in the interfluvial territory.

A. Astrakhan'.

1) General data.

The city is situated 48 degrees 21 minutes latitude North,
48 degrees 2 minutes longitude East. It was founded in 1395 the year
1395 by Tamerlan, conquered by Ivan IV in 1557.

It is the Oblast center of Astrakhan' Oblast. The town is a railroad communication rater center with connections to the central areas of the country and the Caucasus. It has a sea, river and air-port.

Astrakhan' is the most important oil cargo transhipment center in the Soviet Union. The sea-port connects Astrakhan' with Baku, Makhachkala Krasnovodsk and possibly again with Gur'yev. Besides, small-tonnage reach seagoing vessels can mater the Sea of Asov via the Volga-Don canal.

In April 1956 its population numbered 276,000 persons.

The river port connects Astrakhan' with towns along the Volga-Kama and Volga-Don basins.

Stalingrad, Voronezh, Gur'yev.

The city is divided into 5 municipal districts, the district Stalinskiy, Kirovskiy, Leninskiy, Mikoyanovskiy, Trusovskiy (right bank of Volga River).

The city is crisscrossed with manuals riverlets, canals, back-waters. There are 19 bridges within the town-himits. Besides, there are two railroad bridges across the Volga River, one old bridge outside city limits, another two new bridge within the city. The latter bridge was built in 1953 or 1954.

2) Industrial establishment in the city.

In Astrakhan! are located the Maritime oil-tanker shipping line, the river oil-tanker shipping line, the district administration of the Volga consolidated shipping line, the administration of the roadstead technical fleet, administration of "Glavneftesbyt", important major petroleum depots, Main administration of the Caspian fish industry,

the Volga-Caspian state fish trust, the fleet administration of the Volga-Caspian trust, fleet administration of the Uralo-Caspian trust, sea port, river port, fish harbor, airport, railroad station, two fishcanning combines, about 8 ship-repair plants and fish industry machine shops, a ship-yard, a central Diesel-electric power station (Astrakhanskaya THEX TJ Ts., built in 1950), Municipal electric power station, 6-shiprepair plants and machine shops belonging to the River Fleet Ministry, Maritime Fleet shipyard, 3 shiprepair plants and machine shops belonging to the Maritime Fleet Ministry, wood-crating, cooperage, leather plants, food industrial enterprises.

3) Military installations and objects, milice, MVD.

There are in the city: the Oblast Army Commissariat, 5 Rayon Army Commissariats, Naval commandant's office, an Oblast, a City and 5 Rayon committees, of Oblast flyer's club, radio-club, Oblast Milice Administration, 7 Milice branch-offices, MVD and KGB Oblast Administrations, Oblast Fire Administration, 5 fire brigades (not including departmental fire brigades), Army Hospital, MVD medical unit, Astrakhan' garrison (billeted in Kreml' (citadel)), artillery unit (in Krasnykh kazarmakh (Red barracks)), telecommunications unit, Marine unit, Navy school, merchant marine school of the Maritime Fleet Ministry, Army Ammunition depot, Army underground depots, Local Anti-Aircraft defense Hqs (MPVO), Aeroclub-airport, Civil Aviation airport, GlavKasprybprom (Main Caspian Fishing Industries)airbase. Military airport, seaplane base.

4) Other objects and installations.

There are: a Municipal automatic telephone station, branch telephone stations which are connected with the city "Morye", "Reka", Zarechnaya" nets, an MVD commutator, an RR station commutator. There are the following municipal transportation myskems: 9 city and inter-city (suburban) autobus lines, 8 streetcar lines, a municipal river ferry service, local water communications (river trolleys), there is an Oblast radio-station and branch radio-stations of the Maritime Fleet, River Fleet and and Fishing Fleet. There are 5 hospitals, 4 polyclinics, 3 colleges, 11 technical schools. Publications in Astrakhan' city are the Oblast weekly daily

the "volga and the "Sovyetskiy Tanker", a newspaper, which first came out in 1953.

1) General data.

The town is situated 47 degrees 15 minutes latitude North and 51 degrees 52 minutes longitude East. In Kazakh language the town is called Uzya - Balyuzin. It was founded in the first half of the seventeenth century. It has been invaded frequently by Ural Cossacks. It is the Oblast center of the Gur'yevsk Oblast of the Kazakh SSR. The .25X1 population of this town numbers from 60-65,000 persons. The town is connected by railroad with the town of Kandagach. by water with Ural'sk (Ural River). There is also wixxxxxxxxxxxikixxxxiikxxxxxxixx short- and long-distance air connection - to Astrakhan and Alma Ata. Gur'yev has connection with Astrakhan' by automobile (not autobus). Passenger sea communication with Astrakhan was interrupted in 1947 because of a breakdown of the Uralo-Caspian Canal (shallowing). Ships could only go as far as the Gur'yev Maritime Roadstead. Possibly the canal has been dredged and put back to use in the meantime. The town is divided into two sections - a right-bank section (the old town) and a left-bank section (the new town). The left-bank section of Gur'yev sprang up in the Thirties. All industries are concentrated there. A ponton bridge crosses the Ural River in the town. Besides, there are, 3-4 kilometers below the town, two railroad bridges, one over the left branch of the Ural and the other over the right branch. Along with these bridges there are also bridges for truck transports.

2) Industry in the town.

In Gur'yev are located: the fish canning combine imeni Kaganovicha, machine-construction works of the "Kazakhstannyeft" Association, the "Kazakhstannyeft" Association, a machine shop, the large oil-refinery plant No. 441, which was built at the end of WW II (located below the town), a fish-industry ship-repair plant, ship-repair shops of the Gur'yev maritime agency of the "Reydtanker"

-24-

shipping line, River Fleet ship-repair shops, a crate-cooperage plant, a meat combine, a grain combine, a milk processing plant, administration of the Uralo-Caspian Fish Trust. In the area of plant No. 441, a workers town for oil-refinery workers has been built (it is called "Gur'yevskiy zhiloy gorodok).

and-KGB

3) Other organizations.

There are in the town: an Army garrison, MVI Oblast administration, oil-bases, a railroad station, a river landing place, parker markers the Glavneftesbyt" Oblast administration. The town is connected by oil pipelines with the Embensk oilfields and Orsk. Besides, refinery No. 441 is connected by oil-pipeline with the oil base located on the island of Bol'shoy Peshnoy. Ships of the Astrakhansk oil-tanker shipping line "Reydtanker" deliver gas-oil to the oil-base of this island. The town has 15 elementary, 6 7-year and 7 secondary schools with a total student body of about 9,000 pupils. There are 3 labor youth schools, a trade-school for oil-workers, a school for young fishermen, a petroleum, school fishing, agricultural technical school, a pedagogic inskitate, a teachers institute. In 1946 The Uralo-Embinskaya base of the Krakk Kazakh SSR Academy of Sciences was organized in Cur'yev.

Right after the end of WW II, construction of a railroad connecting Gur'yev with Astrakhan' was planned. Construction of this railroad has not been started yet, however. Construction has been in the planning stage for the duration of 2 Five-Year plans and remained there all that time. The Sixth Five-Year plan again provided for construction of this railroad but it remains to be seen what will come of it.

There are two newspapers published in the town. One of them is the "Prikaspiyskaya Kommuna", which is a Russian-language paper and the other one is the "Sotsialistik Kurylys" which appears in the Kazakh language.

The railroad station, river landings, all Oblast and city organizations are located in the left-bank-section of the town. The for Gur'yev main source of electrical power is supplied by plant No. 441. There

are two airports outside town limits. One of them is located on the right bank of the Ural River, about 2 kilometers distant from the town, the other on the left bank of the Ural River, about 5 kilometers distant from the town.

EC marinesti dist.

7. Some additional remarks:

Between 1930 and 1945, the level of the Caspian Sea dropped almost 2 meters and by 1950 it had dropped another 50 centimeters.

As a result there are a great many dead and abandoned settlements at a distance of 10 and somewhere even 15 kilometers from shore in evidence. The former occupants left these settlements and moved somewhere else. Many inlets, like for instance Komsomolets Cove, have disappeared even though they still appear on maps today.

The coastal line got even more cut up by bayous and lagoons, which in the local dialect are called - eriki, prorany, il menya.

As a result of silting-up of the sea, the maritime roadstead, which handles transshipment of cargo from tankers coming from Baku to Astrakhansk vessels, had to be moved further out to sea. Now this roadstead is called the 14 foot maritime roadstead and not the 12 foot roadstead as it was called before.

The climate of the interfluvial territory is harshly continental and dry. Freezingly cold winters and hot summers. In summertime the air-temperature frequently reaches 40 degrees Celsius, but during the winter it often drops to 35-37 degrees Celsius. Forth-East and East winds blow during 9 months of the year. The Sukhovyey, a hot and dry eastern or south-eastern wind, frequently blows in the summer. These winds originate in the southern part of Kazakhstan. Non-freezing weather lasts for 165-200 days. Along a strip, 30-60 kilometers along the sea coast, high humidity prevails during simmertime - breezes predominate (locally they are called "Moryana") The amount of precipitation per year is 150-200. There is rainfall usually in spring and late fall.

There are 42 steam-ferries in the Volga delta and the Volga-Akhtubinsk flood-plain. The average kength of the shipping season in the northern Caspian is 260-265 days.

Approved For Release 2008/11/14: CIA-RDP80T00246A000800790001-6

Major artillery units are stationed in the Kapustina Yara area. East of Kapustina Yara, beyond the Volga river, important large ordnance proving grounds are located. In addition to artillery units, winding the there were also tank units stationed in the Kapustina Yara area in 1951.
